

IMPLANT DENTISTRY

Full Service Implants to Restore Health and Beauty

Implants have become a lot more widespread in recent years, though the technology has existed since the 1960s. Implants are now an excellent alternative to removable dentures, and can even be used in place of crowns and bridges in some cases.

HERE'S HOW IT WORKS:

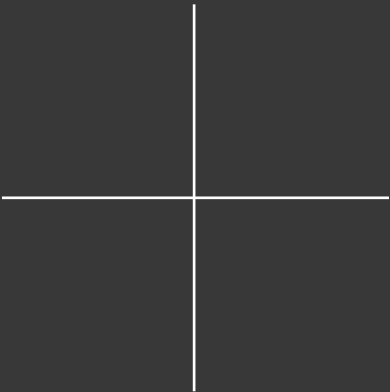

First, an implant post (or posts) are placed in your jaw. Now, sometimes patients have been told they aren't candidates for implants because they don't have adequate bone structure to support the implant posts (which act as roots for your implants), but more widespread availability of bone grafting has increased the number of patients who can have them, so even if you or a loved one have been told in the past that you can't have implants, it might be worth checking.

After the posts are placed and healed, we'll create the perfect, custom restoration using either your existing dentures or x-rays of your teeth.

Dr. Majka offers a number of different types of implants including mini-implants, which take up about half the space of full-sized implants, and are perfect for some patients, and usually a bit less expensive; and implant-retained dentures which are permanent appliances that look like a traditional denture, but without the part that covers the roof of your mouth.
